

# 340B Medication Tracking Integrated with EMR or EHR

## TriNet Medical SRX EMR Integrated Immunization and Medication Tracking Solution

- Increase Practice Efficiency**
- Lower Operational Cost**
- Deliver Quality Patient Care**
- Error-free Data Analytics**

TriNet Medical's SRX solution allows you to scan manufacturer provided barcode on medication, immunization, DME or supply to automate and facilitate capture of data such as Medication name, Manufacturer, NDC code, Lot Number, Expiration Date, etc. within patient chart. SRX system can generate its own 2D barcode for medication that don't have one.

### Increase practice efficiency and productivity

Barcode technology integration with EMR saves time as a single scan captures all the required data automatically into the patient's chart. Entering data manually takes much longer, is susceptible to the risks of human error and may require rework. In some situations, manual entry needs to be recorded in multiple places (e.g., patient's medical record, state registry) for the same patient, increasing both staff time and risk of error.

**Average practice efficiency improved by the use of SRX Barcode solution is about 340%**

### Reduce operational cost with easy Inventory and Lot Management

The SRX system supports inventory and lot management at multiple locations. Inventory and Lot data are available real-time as they are captured using barcode technology, allows administrator to order "just in time," and keep "just the right amount" of medication, supplies, vaccines, etc. on hand. Having less inventory reduces potential wastage and monetary losses due to mechanical failure, natural disaster, power outage, or human error. Lot tracking allows accurate documentation and reporting.

**Average operational cost reduced 50% with the use of SRX Barcode scanning solution**

### Improved patient safety

Additional clinical safety checks that flag an incorrect, expired or recalled item pulled by the clinician when scanned.

### Real-time alerts and reporting

An alert is triggered when an expired or recalled item is scanned. Built in reports provide details of vaccine usage and medication inventory. These assist in managing medication supply and the ordering process. System also provides low inventory and expired inventory alerts.

### Why TriNet Medical's SRX?

- ✓ EMR validated solution
- ✓ Direct integration from within EMR patient chart
- ✓ Barcode scanning integration with 340B and Private medications
- ✓ Required 340B data points for audit preparation
- ✓ Improved billing accuracy with single source of error-free Data
- ✓ Real-time 340B and Private Lot & Inventory management
- ✓ Real-time reports and alerts
